

BIO/STAT 597F, CSE 598F

Bioinformatics I: basic analysis of DNA and protein sequences

Fall semester, 2005

Tues/Thurs 2:30-3:45, 4 Life Sciences

3 credits

Schedule numbers: BIO 597F - 614101; CSE 598F - 613234; STAT 597F - 604711

Web site: <http://www.bx.psu.edu/courses/bx-fall05/>

Prerequisites: Graduate standing or consent of instructors. Familiarity with molecular biology or computer methods is not assumed (though a willingness to learn a little about them is required).

Topics: (estimated time for discussion)

- Introduction to potential class projects. Introduction to molecular biology for the non-biologist. (0.5 weeks)
- Internet resources for identifying genes in a genomic sequence and for predicting a gene's function. Students will use the UCSC Genome Browser, RepeatMasker, GenScan, Blast, and PipMaker. (1 week)
- Further information about potential class projects. (0.5 weeks). At that point, students will need to specify groups and topics for their term projects.
- Selected topics in bioinformatics, including: introduction to algorithms and complexity (1 week), exhaustive search (1 week), greedy algorithms (0.5 weeks), dynamic programming algorithms (1 week), graph algorithms (1 week), combinatorial pattern matching (0.5 weeks), and hidden Markov models (1 week).
- Phylogenetic algorithms, gene and genome history, gene family evolution, models of sequence evolution, and phylogenetic analysis as a predictive tool. (3 weeks)
- Students' in-class reports on their term projects. (3 weeks). Additional reports will be scheduled for the week of final exams.

The course will cover neither protein structure prediction nor "post-sequencing" bioinformatics, such as analysis of expression data (e.g., from micro-arrays), proteomics, and analysis of regulatory networks. Protein structure prediction is covered in courses offered by the Chemistry Department, and post-sequencing bioinformatics is the topic of Bioinformatics II, which is taught most Spring Semesters.

Grading will be based on (1) a term project of the student's choice (60%), (2) an exam over the lecture material (30%), and (3) a few homework assignments, e.g., using World Wide Web resources for analyzing genomic sequences (10%).

Required text:

An Introduction to Bioinformatics Algorithms

Neal C. Jones and Pavel A. Pevzner.

MIT Press, 2004

ISBN 0-262-10106-8
